## SmoothEye®

Laser wrinkle reduction and tightening around the eyes

# What is SmoothEye®?

SmoothEye® is a laser treatment that tightens loose and aging skin of the eyelids and surrounding area, resulting in improved skin elasticity and overall structure. It reduces wrinkles, eye bags and dark circles around the eyes to provide **natural-looking results** with **little to no downtime**.

# How does it work?

SmoothEye® uses the revolutionary Fotona SMOOTH® mode, which treats the skin in a “feather-like” manner with **precisely controlled** temperature deposition. The intense, controlled surface tissue heating stimulates **collagen remodeling** and initiates the production of **new collagen**.

# Proven results and high satisfaction rates

After a few treatments, you can experience a clear **reduction** in the appearance of wrinkles around your eyes, **tighter skin** on your eyelids and a generally more **youthful look**. Three sessions spaced approximately one month apart are recommended. The effect can be seen immediately after the first treatment, while the full results can be observed approximately 4-6 months after the final treatment.

# What is the treatment like?

The SmoothEye® treatment typically lasts 10-15 minutes. Topical anesthetic can be applied before the procedure and you may feel slight heat and/or a prickly sensation. After the treatment moisturizer and sunscreen are recommended. Mostly no downtime is required and you can easily fit the procedure anywhere within your busy schedule.

# Before & After

Before SmoothEye® treatment

6 weeks after 1st treatment

6 weeks after 2nd treatment

8 weeks after 3rd treatment
